The technique of BEER brewing involves a number of carefully regulated stages. First, grains, commonly barley, are malted to activate enzymes that transform the carbohydrate into usable sugars. This germinated grain is then combined with hot water in a process called blending, which extracts the sugars. The resulting mixture, known as wort, is then heated with hops to add flavor and stability.

After simmering, the wort is chilled and seeded with ferment. The yeast converts the sugars into alcohol and carbon. This fermentation takes various days, and the resulting beer is then aged, filtered, and bottled for consumption.
